The present sequence is that of an antifreeze protein of perennial ryegrass. The encoding cDNA was isolated from a leaf and pseudostem CDNA expression library. The invention provides forage grass (perennial recoins and tall fescue) antifreeze proteins and the polymucleotides corrected and tall fescue) antifreeze proteins and the polymucleotides corrected from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides were isolated from different parts of the plants. The polymucleotides can be used to manifreeze polymucleotide, under the control of a gene promoter conterpoint into the genome of the organism, or introducing double-stranded sequence, into the genome of the organism, or introducing double-stranded conterpoint inhibiting expression of an antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a clisor characterised by biocrystals associated with disorders such and kidney stones, tone them a patient e.g. tumour tissue, and crease the content of the plants and the content of the content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze polypetide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to a frozen food product, or treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a
                                                                                                                                                                                                                                                                                                                                                                         /note= "7-amino acid sequence repeat region identified in antifreeze proteins"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of APP3, an antifreeze protein of perennial ryegrass. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymucleotides encoding them ADM41483-ADM41483. The polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold

interest proteins and the polynucleotides encoding them ADM41459-
antifreeze proteins and the polynucleotides encoding them ADM41459-
ADM41483. The polynucleotides were isolated from tissues taken at
different times of year (winter and spring) and from different parts of
the plants. The polynucleotides can be used to modulate the cold
to clerance of an organism, especially plants, mammals, insects, fungi,
carchaea and bacteria. The method involves incorporating an antifreeze
to polynucleotide, under the control of a gene promoter sequence, into the
copynucleotide into the cells of the organism, thereby inhibiting
to the polynucleotide into the cells of the organism, thereby inhibiting
expression of an antifreeze polypeptide. The antifreeze protein can be
cused for the cryopreservation of a cell or tissue, as a food additive of
a frozen food product, in a method for decreasing the time required to
chehydrate a composition, to treat a disorder characterised by biocrysteals
cassociated with disorders such as gout and kidney stones, to preserve the
viability of a molecular biology reagent, to destroy unwanted tissue in a
copy frage or freeding the plant from damage due to
                                            New antifreeze proteins and encoding polymucleotides, useful for modulating cold tolerance in organisms, as food additives, or for treating tumors or disorders associated with the presence of unwanted
                                                                                                                                                                                                                          present sequence is that of an antifreeze protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       65.6%; Score 908.5; DB 8;

The present sequence is that of an antifreeze protein of perennial ryegrass. The invention provides forage grass (perennial ryegrass and tayegrass. The invention provides forage grass (perennial ryegrass and tall feature) antifreeze proteins and the polymucleotides encoding them ADM41458-ADM41483. The polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold to learned of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze of polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the control of the control of the description of a sesociated with disorders such as gout and kidney stones, to preserve the control of the cont

The encoding cDNA was isolated from a root cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) attifreeze proteins and the polynucleotides encoding them ADM41458-ADM41483. The polynucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polynucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting

The present sequence is that of an antifreeze protein of tall fescue. The encoding cDNA was isolated from a leaf blade cDNA expression library. The encoding cDNA was isolated from a leaf blade cDNA expression library. The convention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymucleotides encoding them ADMA1458.

ADMA1483. The polymucleotides were isolated from tissues taken at conferent times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to omodulate the cold cold cold archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the composition of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze polypeptide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the patient e.g. tumour tissue, and to protect a plant from damage due to
                                                                                                                                                                               New antifreeze proteins and encoding polynucleotides, useful for modulating cold tolerance in organisms, as food additives, or for treating tumors or disorders associated with the presence of unwanted

The present sequence is that of AFP4, an antifreeze protein of perennial ryegrass. The encoding cDNA was isolated from a leaf and pseudostem cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymuclectides conding them ADM4158-ADM4183. The polymuclectides were isolated from cirsues taken at different times of year (winter and spring) and from different parts of the plants. The polymuclectides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaed and bacteria. The method involves incorporating an antifreeze polymuclectide, under the control of a gene promoter. Sequence, into the genome of the organism, or introducing double-stranded thereby inhibiting expression of an antifreeze polypeptide. The control of a gene promoter content of the polymuclectide into the cells of the organism, thereby inhibiting expression of an antifreeze polypeptide. The control of a gene promoter content of a cold organism, thereby inhibiting expression of an encrypreservation of a cell or decreasing the time required to dehydrate a composition, to treat a disorder characterised by blocrystals associated with disorders such as a cold and the plants and the proposed organism of a matter of disorder characterised by blocrystals associated with disorders such as the plants of the plants in a patient e.g. tumour tissue, and content of the plants. The plants of the plants and plants of the plants and plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antifreeze proteins and encoding polynucleotides, useful for modulating cold tolerance in organisms, as food additives, or for treating tumors or disorders associated with the presence of unwanted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        from damage due to frost or freezing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 7; SEQ ID NO 21; 71pp; English.

The encoding CDNA was isolated from a basal stem CDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymucleotides encoding them ADM41458-

different times of year (winter and spring) and from different parts of the plants. The polynucleotides can be used to modulate the cold a trolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antiffreeze polynucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze polypeptide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and to protect a plant from damage due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ŝ

The present sequence is that of APP1, an antifreeze protein of perennial ryegrass. The encoding CDNA was isolated from a pseudostem CDNA corpression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymucleotides corpression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter of sequence into the genome of the organism, or introducing double-stranded RNA corresponding to the plants of the organism, or thereby inhibiting expression of an antifreeze polypeptide. The classe, as a food additive of a frozan food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the patient e.g. tumour tissue, and control can patient e.g. tumour tissue, and control can patient e.g. tumour tissue, and

AAY22472 standard; protein; 118 AA.

```
This sequence is the plant anti-freeze protein of the invention. The anti-freeze protein is characterised in that at least 40% of its amino acids are from the group of serine, threonine and apparagine. The amino acids protein can be used in frozen food products, especially frozen confectionery. Anti-freeze proteins are especially infood products, which are heated, e.g. by pasteurisation, blandhing or sterilisation prior to freezing. Plants transformed with a nucleic acid sequence encoding the anti-freeze protein have an increased frost tolerance. Prior at anti-freeze proteins have not been applied to commercially available food products, due to high costs and complicated processes for obtaining the protein. Also prior art anti-freeze proteins have tended to commercially available for destabilise during processing especially during the pasteurisation step. This is overcome by the present anti-freeze protein. The anti-freeze protein ingredient means that mixes can be frozen under quiescent conditions, e.g. in a shop or home freezer without the formation of unacceptable ice crystal shapes and home freezer without the formation of unacceptable ice crystal shapes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     10 MLLVFLGFILQVAGATSWSCHHDDLHALRGLAENLSGKGAVRLRAAW-SGASCCSWEGVG 68

Site_1: EcoRI; Site_2: XhoI; Seeds were germinated and grown at 4 C for 5 weeks. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in the TV Close lab (Choi, Close, Fenton) at the University of California, Riverside. Plasmid DNA preparations and DNA sequencing were performed in the op Anderson lab (all other authors).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Description

                                                                   The present sequence is that of cDNA encoding AFP2, an antifreeze protein of perennial ryegrass. The cDNA was isolated from a leaf blade cDNA expression library. The invention provides forage grass (perennial ryegrass and tall feacue) antifreeze proteins and the polymucleotides cryegrass and tall feacue) antifreeze proteins and the polymucleotides encoding them ADM41483. The polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thoreby inhibiting expression of an antifreeze polypeptide. The crissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology creagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and

                             The present sequence is that of cDNA encoding an antifreeze protein of tall fescue. The cDNA was isolated from a leaf blade cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymucleotides encoding them ADM41458-ADM41483. The polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kindey stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and to protect a plant from damage due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         186
